Atty. Docket No. 010355-9136

Having described the invention, what is claimed is:

1. A method of manufacturing a flow connector, comprising:

molding from a composition comprising at least one polymer a preform having a wall thickness defining an internal cavity and comprising at least two apertures through said wall thickness, and

joining a cap comprising at least one polymer onto at least one of said apertures.

- 2. The method of manufacturing a flow connector according to claim 1 wherein said preform comprises a longitudinal axis and one of said at least two apertures is located at the end of said longitudinal axis.
- 3. The method of manufacturing a flow connector according to claim 2 wherein said preform further comprises a substantially tubular portion disposed around said longitudinal axis.
- 4. The method of manufacturing a flow connector according to claim 3 wherein said substantially tubular portion further comprises a flange disposed around said aperture located at the end of said longitudinal axis and said cap comprises a face having a flange, the flanges of said substantially tubular portion and said cap being configured in shape and thickness to mate and bond with each other.
- 5. The method of manufacturing a flow connector according to claim 4 wherein said substantially tubular portion and said cap further comprise corresponding reservoirs and lips disposed around said flanges for accommodating a melt front of polymer during said joining.

- 6. The method of manufacturing a flow connector according to claim 3 wherein said substantially tubular portion defines a manifold body for fluid handling.
- 7. The method of manufacturing a flow connector according to claim 6 wherein said at least two apertures is a plurality of ports located in said manifold body.
- 8. The method of manufacturing a flow connector according to claim 1 wherein said molding is performed by injection molding.
- 9. The method of manufacturing a flow connector according to claim 8 wherein said injection molding is performed by moving a core pin inside a mold along said longitudinal axis to form said preform.
- 10. The method of manufacturing a flow connector according to claim 1 wherein said joining is performed by a method selected from the group consisting of plastic bonding and plastic welding.
- 11. The method of manufacturing a flow connector according to claim 10 wherein said joining is performed by fusion welding.
- 12. The method of manufacturing a flow connector according to claim 10 wherein said joining is performed by induction-heating joining.
 - 13. The product-produced-by-the-method according to claim 1.
 - 14. The product-produced-by-the-method according to claim 2.

- 15. The product-produced-by-the-method according to claim 8.
- 16. The product-produced-by-the-method according to claim 10.
- 17. A preform for manufacturing a flow-connector, comprising:

a wall thickness defining an internal cavity having a longitudinal axis and comprising at least two apertures through said wall thickness, one of said at least two apertures being located at the end of said longitudinal axis.

- 18. The preform for manufacturing a flow-connector according to claim 17 wherein said preform further comprises a substantially tubular portion disposed around said longitudinal axis.
- 19. The preform for manufacturing a flow-connector according to claim 18 wherein said substantially tubular portion further comprises a flange disposed around said aperture located at the end of said longitudinal axis for joining to a cap.
- 20. The preform for manufacturing a flow-connector according to claim 18 wherein said substantially tubular portion defines a manifold body for fluid handling.
- 21. The preform for manufacturing a flow-connector according to claim 20 wherein said at least two apertures is a plurality of ports located in said manifold body.
 - 22. A flow-connector, comprising:

a wall thickness defining an internal cavity having a longitudinal axis and comprising at least two apertures through said wall thickness, one of said at least two apertures being

Atty. Docket No. 010355-9136

located at the end of said longitudinal axis and having a cap joined to said wall thickness to cover said aperture.

- 23. The flow-connector according to claim 22 wherein said flow connector further comprises a substantially tubular portion disposed around said longitudinal axis.
- 24. The flow-connector according to claim 23 wherein said substantially tubular portion defines a manifold body for fluid handling.
- 25. The flow-connector according to claim 24 wherein said at least two apertures is a plurality of ports located in said manifold body.
